Forget to remember Remember to forget

Long Short Term Memories and Gated Recurrent Units

Jonathon Hare

Vision, Learning and Control University of Southampton

Some of the images and animations used here were originally designed by Adam Prügel-Bennett.

Recap: An RNN is just a recursive function invocation

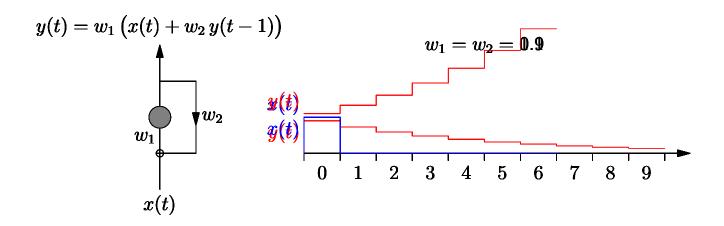

- $\mathbf{y}(t) = \mathbf{f}(\mathbf{x}(t), \mathbf{c}(t)|\mathbf{W}_{\mathbf{f}})$
- ullet and the state $oldsymbol{c}(t) = oldsymbol{g}(oldsymbol{x}(t), oldsymbol{c}(t-1) | oldsymbol{W_g})$
- If the output y(t) depends on the input x(t-2), then prediction will be

$$f(x(t), g(x(t), g(x(t-1), g(x(t-2), c(t-2)|W_g)|W_g)|W_g)|W_f)$$

- it should be clear that the gradients of this with respect to the weights can be found with the chain rule
- ullet The back-propagated error will involve applying $oldsymbol{f}$ multiple times
- Each time the error will get multiplied by some factor a
- If y(t) depends on the input $x(t-\tau)$ then the back-propagated signal will be proportional to $a^{\tau-1}$
- ullet This either vanishes or explodes when au becomes large

LSTM Architecture

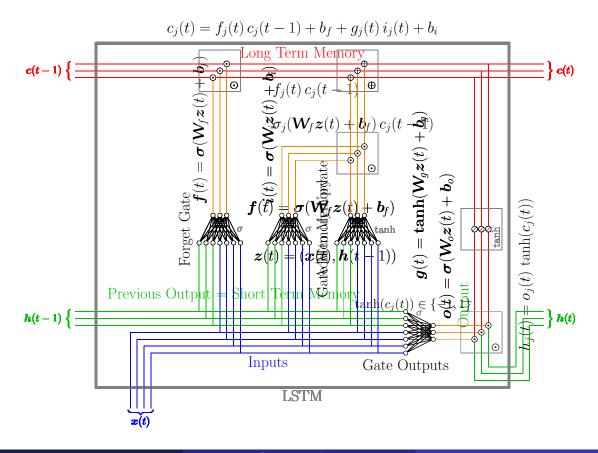

- The LSTM (long-short term memory) was designed to solve this problem
- Key ideas: to retain a 'long-term memory' requires

$$\boldsymbol{c}(t) = \boldsymbol{c}(t-1)$$

- Sometimes we have to forget and sometimes we have to change a memory
- ullet To do this we should use 'gates' that saturate at 0 and 1
- Sigmoid functions naturally saturate at 0 and 1

Update Equations

Initially, for t = 0, h(0) = 0

- Inputs z(t) = (x(t), h(t-1))
- Network updates (W_* and b_* are the learnable parameters)

$$egin{aligned} oldsymbol{f}(t) &= oldsymbol{\sigma}(oldsymbol{W_f} oldsymbol{z}(t) + oldsymbol{b}_f) & oldsymbol{i}(t) &= oldsymbol{\sigma}(oldsymbol{W_f} oldsymbol{z}(t) + oldsymbol{b}_f) \ oldsymbol{g}(t) &= oldsymbol{tanh}(oldsymbol{W_g} oldsymbol{z}(t) + oldsymbol{b}_g) & oldsymbol{o}(t) &= oldsymbol{\sigma}(oldsymbol{W_o} oldsymbol{z}(t) + oldsymbol{b}_o) \end{aligned}$$

Long-term memory update

$$c(t) = f(t) \odot c(t-1) + g(t) \odot i(t)$$

• Output $\boldsymbol{h}(t) = \boldsymbol{o}(t) \odot \operatorname{tanh}(\boldsymbol{c}(t))$

Training LSTMs

- We can train an LSTM by unwrapping it in time.
- Note that it involves four dense layers with sigmoidal (or tanh) outputs.
- This means that typically it is very slow to train.
- There are a few variants of LSTMs, but all are very similar. The most popular is probably the Gated Recurrent Unit (GRU).

Jonathon Hare LSTMs and GRUs 8 / 1:

LSTM Success Stories

- LSTMs have been used to win many competitions in speech and handwriting recognition.
- Major technology companies including Google, Apple, and Microsoft are using LSTMs as fundamental components in products.
- Google used LSTM for speech recognition on the smartphone, for Google Translate.
- Apple uses LSTM for the "Quicktype" function on the iPhone and for Siri.
- Amazon uses LSTM for Amazon Alexa.
- In 2017, Facebook performed some 4.5 billion automatic translations every day using long short-term memory networks¹.

Gated Recurrent Unit (GRU)

Jonathon Hare LSTMs and GRUs 10 / 13

Gated Recurrent Unit (GRU)

- x(t): input vector
- h(t): output vector (and 'hidden state')
- r(t): reset gate vector
- z(t): update gate vector
- n(t): new state vector (before update is applied)
- W and b: parameter matrices and biases

Jonathon Hare LSTMs and GRUs 11 / 13

Gated Recurrent Unit (GRU)

Initially, for
$$t = 0$$
, $h(0) = 0$

$$egin{aligned} oldsymbol{z}(t) &= \sigma(oldsymbol{W}_{z}(oldsymbol{x}(t), oldsymbol{h}(t-1)) + oldsymbol{b}_{z}) \ oldsymbol{r}(t) &= \sigma(oldsymbol{W}_{r}(oldsymbol{x}(t), oldsymbol{h}(t-1)) + oldsymbol{b}_{r}) \ oldsymbol{n}(t) &= anh(oldsymbol{W}_{n}(oldsymbol{x}(t), r(t) \odot h(t-1)) + oldsymbol{b}_{h}) \ oldsymbol{h}(t) &= (1 - oldsymbol{z}(t)) \odot oldsymbol{h}(t-1) + oldsymbol{z}(t) \odot oldsymbol{n}(t) \end{aligned}$$

Most implementations follow the original paper and swap (1-z(t)) and (z(t)) in the h(t) update; this doesn't change the operation of the network, but does change the interpretation of the update gate, as the gate would have to produce a 0 when an update was to occur, and a 1 when no update is to happen (which is somewhat counter-intuitive)!

Jonathon Hare LSTMs and GRUs 12 / 13

GRU or LSTM?

- GRUs have two gates (reset and update) whereas LSTM has three gates (input/output/forget)
- GRU performance on par with LSTM but computationally more efficient (less operations & weights).
- In general, if you have a very large dataset then LSTMs will likely perform slightly better.
- GRUs are a good choice for smaller datasets.
